TITLE: Heat-resistant chromium-molybdenum steel [CZ Pat PV 1987-62]

SOURCE: Hutnicke listy, no. 12, 1965, 907

TOPIC TAGS: steel, heat resistant steel, molybdenum containing steel, chromium containing steel

ABSTRACT: This patent introduces a heat-resistant chromium-molybdenum steel containing 0.12—0.25% C, 0.3% max Si, 7.5—8.5% Cr, 1.5—2.5% Mo, 3% of one or more of Va, W, Ti, B, Nb, Ta, N, and Co, and balance Fe. The S and P content should not exceed 0.02% each. This steel is intended for prolonged service at temperatures above 500C, especially for superheaters of steam boilers. Orig. art. has: 1 table. [WW]

4238. EFFECT OF COAL PREPARATION IN EXTRACTION OF RAW MONTAN WAX. Thieberger, H.
and Ygalak, V. (Paliva, Aug. 1950, vol. 30, 262-269).

Results are given of research and tests on an industrial scale by the Coal Research Institute in Prague on extraction by organic solvents, benzene in particular. Best results were obtained with a coal grain size of 8 to 20 mm depending on the type of coal and with a moisture content between 10 and 18%. Thermal pre treatment of the coal almost doubled the yield. Chemical pre treatment raised the pour point and altered other properties of the product. Electrical pre treatment is still in the experimental stage.

The detection and estimation of phenols in water. L. Schumann and H. Thieberger. *Chem. Abstr.* 13, 1-2 (1918).—After an investigation of Br. water, Millon's reagent, Hinden's, Fox-Gauche, and Folin-Denis reagent, the authors treat (a) a 200 cc. sample of water with 10 cc. of 20% H_2SO_4 , or (b) the water with 0.2% NaOH , let it stand overnight, remove the sludge, add H_2O and distill the liquid. The distillate contained 10% of the added phenols. Even without a special colorimeter it was possible to detect phenols in the range 0.1 to 3.0 mg. per l. of water. The use of H_2PO_4 instead of H_2SO_4 was not satisfactory for detns., for some of the H_2PO_4 passed into the distillate intensifying the color and giving readings which were too high. Waters contg. less than 0.1 mg. phenol per l. had to be concd.; while those waters contg. more than 3 mg. phenol per l. had to be diltd. with 5 vols. of water or had to be tested with Br. water. The concn. of dil. solns. could not be done in open air but had to be done in closed vessels.

The effect of coal preparation on yield of raw montan wax. Herbert Thieberger and Vladimir Věselák (Coal Research Inst., Prague, Czech.). *Palma* 33, 202 (1950). -- The pretreatment of coal has a marked effect on the yield of raw montan wax by extrn. with org. solvents such as $C_{12}H_{26}$. The most convenient grain size for extrn. is between 8 and 10 mm., depending on the coal type. The H_2O content should be between 10 and 18%. Thermal pretreatment of the coal at 250° under pressure may nearly double the yield of wax. Chem. pretreatment, such as by acid or base, effects a change in compn. as shown by a higher pour point and different phys. and chem. properties. Submitting coal to an elec. current increases the yield of wax as is indicated by preliminary work.

The Action of Ozone on Alkali Metals, Ammonia, and Substitution Products of Ammonia.
Ber., 1920, 5, (B) pp. 2096-2113.

Journal of Chemical Society, 1921, p. 44

The action of ozone on solutions of the alkali and alkaline earth metals in liquid ammonia was investigated in the hope of elucidating the constitution of the products obtained by Traube and others by the action of ozone on concentrated sodium or potassium hydroxide solutions. Although precipitates were obtained which appeared to be ozonides of potassium, sodium, rubidium, caesium, calcium, and barium, these could not be obtained in a pure state on account of by-products formed by the action of ozone on ammonia. The compounds obtained were orange to brown in color, readily decomposed by water or dilute acids with evolution of oxygen, and giving the hydrogen peroxide reaction with titanium sulphate solution. The oxonides of rubidium and caesium are the most stable of those prepared. Quantitative experiments on the action of ozone on liquid ammonia cooled in a carbon dioxide-ether mixture showed that the ozone was completely reduced, the products of the reaction being about 98% of ammonium nitrate and 2% of nitrite. When ozone is first passed into the liquid ammonia, an orange color appears which may be due to the formation of an unstable ozonide. Carefully dried ozone at first acts very slowly on liquid ammonia but as the reaction proceeds it acts more rapidly.

Journal of Chemical Society, 1921, p. 17.

Hydroxylamine hydrate reacts readily with ozone, hydroxylamine nitrate being the main product of the reaction. The reaction is not complete, excess of ozone being required. Hydrazine hydrate is oxidized by ozone principally to nitrogen and water, only small quantities of hydrazine and ammonium nitrates being formed. Methylamine and ozone react to form formaldehyde with ammonia and methylenediamine, nitrate and nitrite. Dimethylamine reduces ozone rapidly and completely, the reaction products identified being nitrate, nitrite, formaldehyde, and formic and acetic acids. The reaction between trimethylamine and ozone is explosive, even at the temp. of an ether-carbon dioxide mixture, and it was necessary to use a 5-10% solution of trimethylamine in chloroform to study the reaction. The product of the reaction was trimethylamine oxide, $O:NMe_3$, which was precipitated from the chloroform as the hydrochloride, the hydrochloric acid being formed by the oxidizing action of ozone on chloroform.

ABSTRACT

: Polyphosphates (P) were studied by the method of paper chromatography. The experiments were conducted in an acid medium, using as a solvent a mixture of iso-C₃H₇OH (70 cm³), H₂O (10 cm³) and CCl₃COOH (20 cm³), with the addition of small quantities of NH₄OH and other hydroxides of single-charge cations. It was shown that in the series (CH₃)₄NOH, LiOH, NH₄OH, NaOH and KOH,

AUTHORS:

Thilo, Erich and Jost, Karl Heinz

TITLE:

Data on the structures of anion chains in water-insoluble, crystalline, high-molecular-weight alkali polyphosphates. Preliminary structural data on $[\text{Na}_2\text{H}(\text{PO}_3)_3]_x$ and on the B-form of the Kurrol salt $\text{Na}_n\text{H}_2\text{P}_{n+1}\text{O}_{3n+1}$

PERIODICAL: Kristallografiya, v.6, no.6, 1961, 828-830

TEXT: So far four types of anion chains have been found in polyphosphates: (a) $(\text{LiPO}_3)_x$ type with repeat 5.2 Å; (b) $(\text{RbPO}_3)_x$ type with repeat 4.2 Å; (c) Maddrell salt (high temp. form) with repeat 7.0 Å (over 3 tetrahedra); (d) Kurrol salt, A- $(\text{NaPO}_3)_x$ with a spiral structure of repeat distance 6.1 Å over 4 tetrahedra. J.W. Gryder, G. Donnay and H.M. Ondik (Ref.8; Acta crystallog., II, 38, 1958) have described a unit cell for "Form I of $\text{Na}_2\text{P}_4\text{O}_{11}$ " with space group $\text{P}2_1/a$ and cell dimensions $a' = 30.7$, $b' = 6.77$, $c' = 7.12$ Å and $\beta' = 94.0^\circ$. This material, from its description and method of preparation, appears identical with $[\text{Na}_2\text{H}(\text{PO}_3)_3]_x$

Card 1/2

Data on the structures of anion

S/070/61/006/006/001/008
E132/E135

which has the space group $P\bar{1}$ (possibly $P1$) and dimensions
 $a = 7.72$, $b = 6.76$, $c = 7.11 \text{ \AA}$; $\alpha = 90.6^\circ$, $\beta = 92.4^\circ$, $\gamma = 103.1^\circ$,
 $Z = 2$. Preliminary structure analysis shows chains with a
repeating unit of three tetrahedra (Dreierketten) parallel to the
y-axis. For the B-form of Kurrol salt the same cell as that found
by D.E.C. Corbridge (Ref.9. Acta crystallogr., 8, 520, 1955) is
found. The anion chain is a helix with four tetrahedra per turn
having its axis parallel to \underline{b} . The Na ions which in the A-form
are 5-coordinated by O here have 6-coordination.

There are 3 figures and 9 references: all non-Soviet.

Budapest, A Magyar Tudományos Akadémia Biológiai Tudományok Osztályának Közleményei, Vol IX, No 3-4, 1966, pages 263-282.

Abstract: Remains of 4 milk teeth and a skull were found at the site which is judged to be 440-460 thousand years old. The present article deals with the detailed description of the teeth and some conclusions are derived concerning the taxonomical and phylogenetic place of the Vertesszollos man, and the importance of the findings with respect to the general course of human evolution. 1 Hungarian, 10 Western references.
